Corn is used to make:
- breakfast cereal
- bread
- whisky
- livestock feed
- fish bait

It's even used to create products like:
- toothpaste
- stamps
- starch for clothing
- ethanol for fuel

There are TWO TYPES of corn:
- FIELD CORN mainly for animal feed and industrial uses
- SWEET CORN for human consumption

Sweet corn is grown in every province, on 20,000 hectares of land.

The majority is grown in Ontario and Quebec.

Canada harvests 1,300,000 hectares of corn annually.

That's almost enough to cover the surface area of Lake Ontario!

On average, Canada exports more than 10% of its total corn production.

That's over 1.4 BILLION KG annually.

Canada is an international leader in corn breeding. In fact, many of our corn varieties are used in scientific research studies around the world.

We grow a lot more than you may think
